The Shockwave Medical
Intravascular Lithotripsy (IVL) System

DESIGNED TO DELIVER

71% Target Lesion Primary Patency*

The COVERA™ Vascular Covered Stent utilizes a unique, helical design intended to balance the flexibility and strength required for tortuous outflow anatomy of the venous anastomosis. In fact, the AVeVA Clinical Study demonstrated a 71% target lesion primary patency rate at 6 months.* The COVERA™ Vascular Covered Stent is built upon proven technologies from the category leader in AV Access.

To find out more about how the COVERA™ Vascular Covered Stent was designed to help you deliver results, visit www.bardpv.com.

71%
Target Lesion
Primary Patency*

COVERA™
Vascular Covered Stent

*Target Lesion Primary Patency (TLPP) of 71%, defined as the interval following the index intervention until the need for clinically driven reintervention at or adjacent to the original treatment site or until the stent was abandoned for permanent access. Freedom from primary safety events = 90.4%, defined as freedom from any adverse events, localized or systemic, that necessitate surgical or endovascular treatment of the AV access (stent pull including thrombotic or traumatic), that results or leads to any of the following: stent or stent component additional interventions (including surgery); inpatient hospitalization; or prolongation of an existing hospitalization or death.
